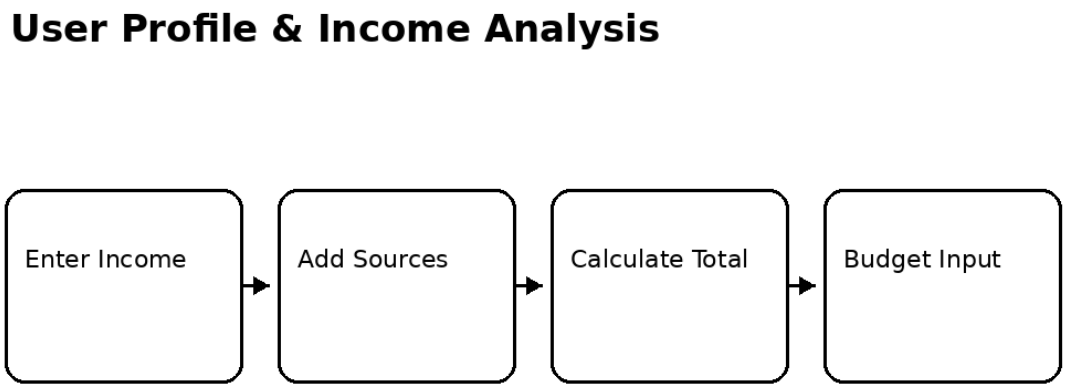
2.1 User Income Details

1. Introduction

User Income Details is the foundation of a personal finance management system. The module collects important information about a user's monthly income, additional income and regular sources of earnings. This information helps the system understand the amount of money available for expenses, savings and financial goals. Accurate income information allows the system to create a practical budget instead of using general assumptions.



2. Objectives

• Record the user's main monthly income.

• Record additional or occasional income sources.

• Maintain a clear income history.

• Calculate total available income.

• Use income information for budgeting and savings planning.

3. Detailed Working Process

• The user enters the primary monthly income.

• Additional income sources can be entered separately.

• The system validates the entered amounts.

• All income sources are combined to calculate total income.

• The total income becomes an input for expense and savings planning.

• The income details can be updated when the user's financial situation changes.

4. Key Features

• Monthly income entry

• Additional income entry

• Income source description

• Total income calculation

• Income history

• Budget planning support

5. Benefits

• Provides a clear picture of available money.

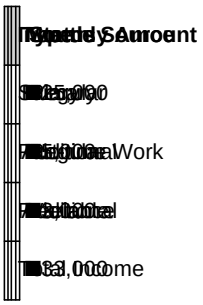
• Supports realistic budget creation.

• Helps determine an appropriate savings amount.

• Makes income changes easier to monitor.

• Provides basic data for financial analysis.

6. Sample Data Table



7. Sample Python Coding

```
# User Income Details
salary = float(input("Enter monthly salary: "))
part_time = float(input("Enter part-time income: "))
freelance = float(input("Enter other income: "))

total_income = salary + part_time + freelance

print("\n--- INCOME SUMMARY ---")
print("Salary: ■", salary)
print("Part-time Income: ■", part_time)
print("Other Income: ■", freelance)
print("Total Income: ■", total_income)
```

8. System Integration

This module can be connected with expense tracking, savings, budgeting and reporting modules. The user's income, spending behavior and goals can be combined to create a more personalized financial management workflow.

9. Conclusion

User Profile & Income Analysis provides the basic information required for personalized financial planning. By combining income details, spending habits and financial goals, the system can organize budgets and recommendations around the user's actual financial information.
