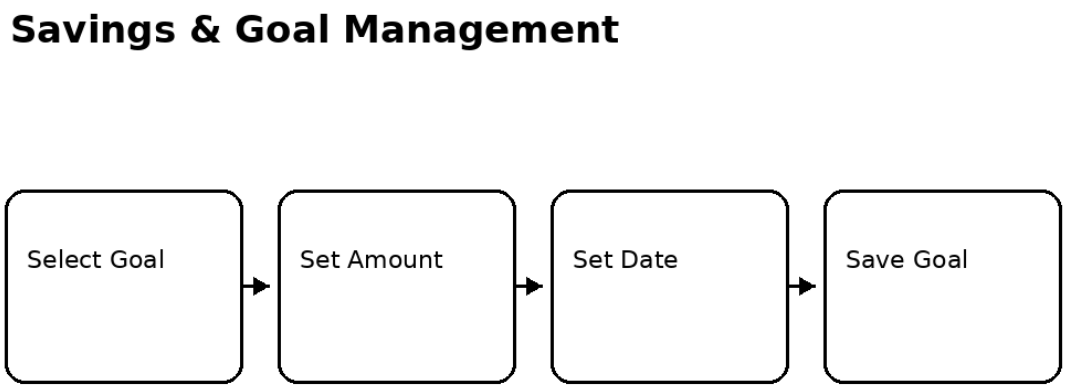
7.1 Savings Goal Setting

1. Introduction

Savings Goal Setting is a module of a personal finance management system that helps users define clear financial targets. Instead of saving without a specific purpose, the user can create a goal with a name, target amount, target date and category. Examples include education expenses, travel, purchasing a laptop or mobile device, and general savings. A clearly defined goal gives the user a measurable objective and makes future financial planning more organized.



2. Objectives

• Create one or more financial goals.

• Specify the target amount required for each goal.

• Set a target date for completing the goal.

• Choose a meaningful category for the goal.

• Keep goal information available for later progress tracking.

3. Detailed Working Process

• The user opens the Savings Goal section.

• A goal name is entered, for example, Education Fund.

• The target amount is entered.

• A target date is selected.

• The system validates and stores the goal.

• The saved goal can later receive contributions and progress updates.

4. Key Features

• Goal name and description

• Target amount

• Target date

• Goal category

• Active/completed status

• Support for multiple goals

5. Advantages

• Clear financial direction

• Better organization of savings

• Easy measurement of financial targets

• Helps divide large targets into smaller contributions

• Useful for future budgeting and reporting

6. Sample Data Table

7. Sample Python Coding

```
# Savings Goal Setting
goals = []

name = input("Enter goal name: ")
target = float(input("Enter target amount: "))
date = input("Enter target date: ")
category = input("Enter category: ")

goal = {
"name": name,
"target": target,
"date": date,
"category": category
}
goals.append(goal)

print("\n--- SAVINGS GOAL ---")
print("Goal:", name)
print("Category:", category)
print("Target Amount: ■", target)
print("Target Date:", date)
print("Goal saved successfully.")
```

8. Example

Example: A user wants to save ■30,000 for education within ten months. The user creates an Education Fund goal with a target of ■30,000 and enters the expected completion date. The system stores the goal so that future savings can be added and monitored.

9. System Integration

This module can be connected with the expense tracking, budgeting, notification and reporting modules. Goal information can be stored in a database and displayed through a dashboard. The same data can also be used to create monthly summaries and progress charts.

10. Conclusion

Conclusion: Savings Goal Setting provides a structured way to define financial targets. It converts a general intention to save into a clear and measurable objective. This module becomes more useful when connected with progress tracking and monthly financial reports.
