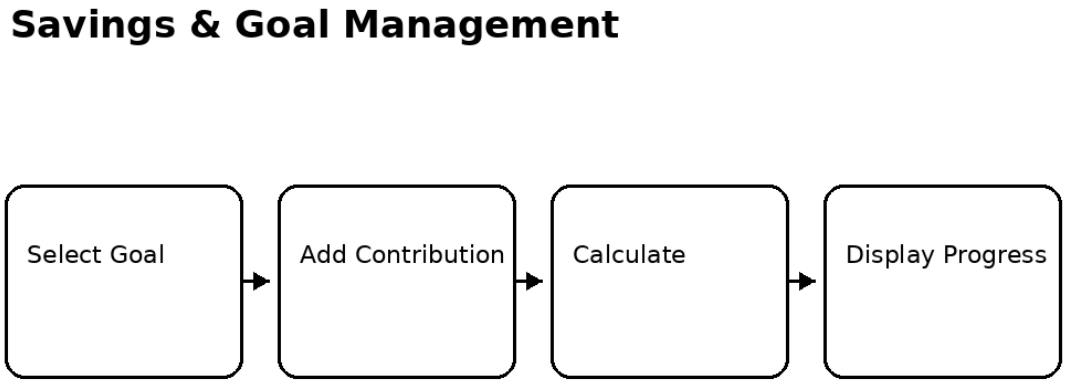
7.2 Savings Progress Tracking

1. Introduction

Savings Progress Tracking is used to monitor how much money has been saved toward each financial goal. Whenever the user makes a contribution, the system updates the saved amount. It can calculate the remaining amount and the percentage of the target that has been completed. This gives the user a simple view of current progress and helps maintain an organized savings record.



2. Objectives

• Record each savings contribution.

• Maintain the total amount saved for every goal.

• Calculate the remaining amount automatically.

• Calculate the percentage of goal completion.

• Display an updated progress status.

3. Detailed Working Process

• The user selects an existing savings goal.

• The contribution amount is entered.

• The system adds the contribution to the existing saved amount.

• The remaining amount is calculated.

• The progress percentage is calculated.

• The updated result is displayed and stored for future reference.

4. Key Features

• Contribution entry

• Automatic total calculation

• Remaining amount calculation

• Progress percentage

• Completed/in-progress status

• Progress history

5. Advantages

• Shows current savings clearly

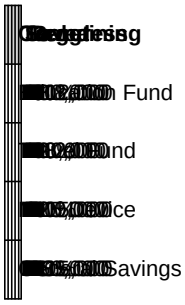
• Helps identify unfinished targets

• Makes progress easy to understand

• Supports regular saving decisions

• Useful for financial reports and dashboards

6. Sample Data Table



7. Sample Python Coding

```
# Savings Progress Tracking
target = float(input("Enter target amount: "))
saved = float(input("Enter amount already saved: "))

remaining = max(target - saved, 0)
progress = (saved / target) * 100

print("\n--- SAVINGS PROGRESS ---")
print("Target: ■", target)
print("Saved: ■", saved)
print("Remaining: ■", remaining)
print("Progress:", round(progress, 2), "%")

if saved >= target:
print("Goal completed!")
else:
print("Goal is still in progress.")
```

8. Example

Example: If the target is ■30,000 and the user has saved ■18,000, the system calculates ■12,000 as the remaining amount and 60% as the progress. When additional savings are entered, the result is updated.

9. System Integration

This module can be connected with the expense tracking, budgeting, notification and reporting modules. Goal information can be stored in a database and displayed through a dashboard. The same data can also be used to create monthly summaries and progress charts.

10. Conclusion

Conclusion: Savings Progress Tracking provides continuous visibility into financial goals. By showing saved, remaining and percentage values, the module helps users understand their current position and maintain organized records of contributions.
