8. Reports & Dashboard

8.1 Expense Charts and Graphs

The dashboard presents financial information using charts, graphs, and category summaries. Instead of displaying only a long list of transactions, the system converts financial data into visual information that can be understood quickly.

Expense charts help users identify which categories consume the largest portion of their money. Common categories may include food, transportation, bills, shopping, education, entertainment, and other personal expenses.

Bar charts can be used to compare spending between categories, while pie charts can show the percentage contribution of each category to total expenses. Line graphs can also be used to display changes in spending over time.

The visual dashboard supports better financial awareness because users can immediately notice unusual increases, high-spending categories, and changes in their normal spending pattern.

Key Features

• Category-wise expense visualization

• Comparison of high and low spending categories

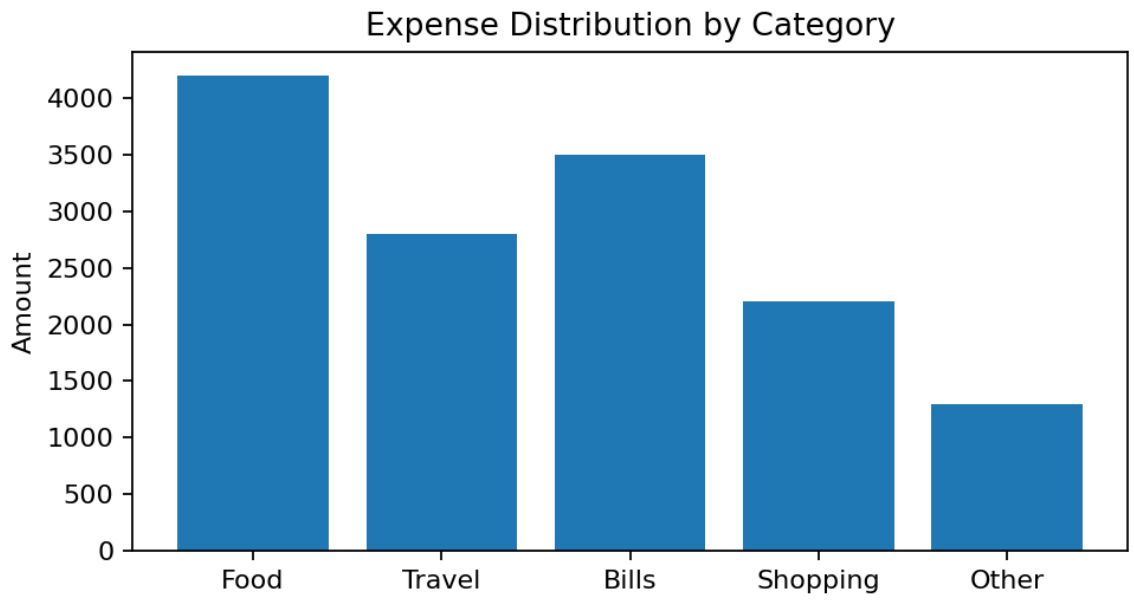

• Monthly and weekly expense trends

• Automatic calculation of category totals

• Easy-to-understand graphical dashboard

• Identification of unusual spending patterns

Illustrative Dashboard

Coding Table

Component	Example Code / Function
Get expenses	expenses = getExpensesByCategory();
Calculate total	total = calculateTotal(expenses);
Create chart	createBarChart(expenses);
Show summary	showCategoryTotals(expenses);
Refresh dashboard	refreshExpenseDashboard();
